

Test 3 Array

The GeneChip® Test3 Array contains probes representing a subset of characterized genes from various organisms including mammals, plants and eubacteria. For each eukaryotic organism probes are derived from 5', middle, and 3' portions of the gene represented on the array. By measuring signals from these three probe sets, researchers can identify degraded samples containing insufficient target that may result in poor expression array results.

We recommend using GeneChip® Test3 Arrays whenever NuGen's WT- Pico kit is used. This can help conduct experiments with confidence, and achieve more consistent results. The GeneChip® Test3 Array provides a convenient and accurate means of determining the quality of labeled target prior to analysis on GeneChip® expression arrays, allowing you to proceed with your gene expression experiments with confidence.
